

Please amend claims 1, 7, 30, 32, 35 and add new claim 40 as follows:

1. (TWICE AMENDED) A stackable crate for holding and transporting products comprising:

a side wall integrally formed with a bottom surface, the side wall formed so that at least a portion of an opening in the crate at a first distance from the bottom surface has a larger dimension than the bottom surface; and

a drag rail formed on an underside portion of the bottom surface and positioned inward of an outer peripheral support surface of the crate, the side wall formed so that a top surface of the side wall would contact the outer peripheral support surface of a like crate stacked thereon,

wherein a portion of an inner surface of the side wall at the first distance from the bottom surface is formed to reduce the dimension of the crate opening in at least one selected area so as to provide a tighter fit with a drag rail of the like crate stacked thereon.

7. (AMENDED) A crate for holding and transporting products comprising:

a side wall integrally formed with a bottom surface; and

a drag rail protruding from an underside portion of the bottom surface, the drag rail including a drag surface that is the lowermost surface of the crate, wherein an inner surface of the side wall is formed to position at least a portion of the side wall over the drag rail.

C 3 Sub
DL

30. (AMENDED) The crate of claim 7 wherein the drag rail protrudes downward from the underside portion of the bottom surface inward of the outer edge of the crate, the side wall meeting the bottom surface at a lower corner of the crate, the side wall further including a contact surface on a lower edge of the side wall adjacent to and outward of the drag rail at the lower corner, the contact surface dimensioned so as to rest on a top surface of a side wall of an identical crate.

Sub
DL

32. (AMENDED) First and second identical stacked crates for holding and transporting products each comprising:

C 4

a side wall integrally formed with a bottom surface, an inner surface of the side wall moving outwardly from a vertical plane as the side wall extends upwardly from the bottom surface to enlarge an opening of the crate at a first distance from the bottom surface, at least one selected area of the side wall at the first distance from the bottom surface comprising a portion of the inner surface of the side wall formed to reduce the dimension of the crate opening at the at least one selected area;

a drag rail extending from an underside portion of the bottom surface, the drag rail positioned inward of an outer peripheral edge of the crate; and

the first crate supported on a top surface of the side wall of the second crate with the drag rail of the first crate positioned inward of the side wall and the at least one selected area of the second crate so as to provide a tighter fit between the drag rail of the first crate and the at least one selected area of the second crate.

35 (AMENDED) A stackable crate for holding and transporting products comprising:

a plurality of side walls generally perpendicular to and integrally formed with a bottom surface, an inner surface of each of the side walls moving outwardly from a vertical plane as the side wall extends upwardly from the bottom surface to enlarge an upper opening of the crate at a first distance from the bottom surface, at least one portion of an upper edge of each of the side walls being vertically aligned with at least one portion of a lower edge of the each of the side walls; and

a drag rail formed on an underside portion of the bottom surface and positioned inward of an outer periphery of the lower edges of the plurality of side walls,

wherein a portion of the inner surface of at least one of the side walls is formed to reduce the dimension of the upper opening of the crate in at least one selected area at the first distance from the bottom surface so as to provide a tighter fit with a drag rail of an identical crate stacked thereon.

Please add the following new claim:

40. (NEW) The stackable crate of claim 1 wherein the drag rail protrudes downwardly from the underside portion of the bottom surface and wherein the drag rail includes drag surface that is a lowermost surface of the crate.
